

Qwlr Task Report

1, Overall finished the task and spent around 10 hours, I am really sorry about the extra hours but want to be honest. and the key decision i have made is, I decided to have a robust backend and also use decide spent less time on the frontend.

2, User have to login to use the app, and also can signup a new user if needed. I have made a assumption that the total asset of a user is the value of the stock current user is holding. and a known bug is django authentication is not working for `localhost` but work for 127.0.0.1 in my case. I spent some time figured it out why but didn't make it. I guess it is related to some tricky django setting

3, The setting of the django is slow me down, and also the bug mentioned above. I spend many time. And they are all unexpected for me.

4, I was having some problem to use the django authentication to do sign up and login. So I google online and read about the document and finally solved the problem.
